

## ONLINE SEARCH REQUEST FORM

\*\*\*\*\*

USER SPECTOR U.S. SERIAL NUMBER 243545  
ART UNIT 1812 PHONE 308-1793 DATE 4/3/95

Please give a detailed statement of requirements. Describe as specifically as possible the subject matter to be searched. Define any terms that may have special meaning. Give examples or relevant citations, authors, or keywords, if known.

You may include a copy of the broadest and or relevant claim(s).

→ see CRF for parent 08/162407  
Please search Seq 10 145,  
also ~~a~~ reverse translate  
& search aa 28-182 of 106.

Thanks!

Cut-off raised to 64.  
Cut-off raised to 67.  
Cut-off raised to 70.

The scores below are sorted by initial score.  
Significance is calculated based on initial score.

A 100% identical sequence to the query sequence was not found.

The list of best scores is:

Sequence Name	Description	Length	Score	Init. Opt.	Sig. Frame
1. MUSLIGAND	*** 60 standard deviations above mean *** Mouse flt3 ligand mRNA, compl	829	829	829	60.20 0

FastDB - Fast Pairwise Comparison of Sequences

Release 5.4

Results file sqlinv.res made by on Wed 5 Apr 95 21:32:49-PDT.

Query sequence being compared: US-08-162-407-1' (1-879)  
 Number of sequences searched: 313646  
 Number of scores above cutoff: 4947

Results of the initial comparison of US-08-162-407-1' (1-879) with:  
 Data bank : EMBL-NEW 1, all entries  
 Data bank : GenBank 86, all entries  
 Data bank : GenBank-NEW 1, all entries  
 Data bank : UEMBL 41\_86, all entries

Cut-off raised to 62.

Cut-off raised to 65.

Cut-off raised to 67.

The scores below are sorted by initial score.

Significance is calculated based on initial score.

A 100% identical sequence to the query sequence was not found.

The list of best scores is:

Sequence Name	Description	Length	Score	Init. Opt.	Sig.	Frame
1. GCRINVA	*** 13 standard deviations above mean *** G.crassicaudatus involucrin g	1155	197	406	13.13	0

COMMENT NOTES:

This is a cosmid fragment sequenced to bridge the gap between

cosmids ZK643 and R08D7.

Bases 1 to 86 of this entry correspond to bases 39449 to 39534 of

cosmid ZK643 (EMBL:CEZK643, accession number Z11126). Bases 1758 to

1762 of this entry correspond to bases 1 to 5 of cosmid R08D7

(EMBL:CER08D7).

GORINVOLDB	Gorilla gorilla involucrin gene medium allele, com
LOCUS	GORINVOLDB 1818 bp ds-DNA PRI 08-SEP-1994
DEFINITION	Gorilla gorilla involucrin gene medium allele, complete cds.
ACCESSION	M23604 J04499
KEYWORDS	epidermal protein; involucrin.
SOURCE	Gorilla gorilla (individual isolate Gorilla K) (library: vagina) DNA.
ORGANISM	Gorilla gorilla
	Eukaryota; Animalia; Chordata; Vertebrata; Mammalia; Theria;
	Eutheria; Primates; Haplorhini; Catarrhini; Pongidae.
REFERENCE	1 (bases 1 to 1818)
AUTHORS	Teumer, J. and Green, H.
TITLE	Divergent evolution of part of the involucrin gene in the hominoids: Unique intragenic duplications in the gorilla and human
JOURNAL	Proc. Natl. Acad. Sci. U.S.A. 86, 1283-1286 (1989)
STANDARD	full automatic
COMMENT	Draft entry and computer readable copy of sequence [1] kindly provided by J.K. Teumer (03-31-89).

The scores below are sorted by initial score.  
Significance is calculated based on initial score.

A 100% identical sequence to the query sequence was not found.

The list of best scores is:

Sequence Name	Description	Length	Score	Init. Opt.	Sig. Frame
1. Q13718	Phytoene synthase.	1198	147	398	8.69 0

PT	New nucleic acid encoding human mevalonate kinase - and derived	
PT	polypeptide(s) for studying cholesterol biosynthesis, identifying	
PT	cholesterol lowering agents or detecting mevalonate aciduria.	
PS	Claim 1; F1g 1; 44pp; English.	
CC	The DNA sequence was determined using the dideoxychain termination	
CC	method. The sequence or homologous DNA can be labelled for use in	
CC	detecting sequences encoding hmk, specifically for detecting the	
CC	genetic disorder mevalonic aciduria which is characterised by low	
CC	levels of hmk-coding sequences.	
SQ	Sequence 1971 BP; 384 A;	601 C; 597 G; 389 T;

PT Heterologous protein expression on prokaryotic host -  
PT using 3' truncated chloramphenicol acetyl transferase gene to  
PT stably express hybrid protein.  
PS Example; Fig 10; 67pp; English.  
CC When inserted into an expression vector, pTIPCAT 72,  
CC the construct gave 10-15% levels of fusion protein upon  
CC induction in W3110 cells.  
CC See also Q03557 to Q03566; and Q04767.

[illegible]

DR WPI; 92-398792/48.  
PT P-FSDB; R28934.  
PT DNA coding for vitamin-K-dependent carboxylase - for prodn. of  
PT transformed cells producing carboxylated vitamin=K-dependent  
PT proteins, e.g. clotting factors  
PT Claim 1; Page 36; 55pp; English.  
PS This sequence encodes a vitamin K-dependent carboxylase. The 1.6kb  
CC insert from lambdaZAP-CARBI.6 was used to screen a human cDNA  
CC library. No clones however, coded for the entire sequence of the gamma  
CC glutamyl carboxylase. They did allow comparison of liver carboxylase to  
CC the carboxylase of another tissue. A second cDNA library constructed  
CC using HEL cells (human erythroleukaemia) was screened and a clone  
CC isolated. This contained the entire coding sequence of the human  
CC carboxylase and some upstream and downstream sequences.  
SQ Sequence 2452 BP; 541 A; 654 C; 640 G; 617 T;

PT	Hepatocyte growth factor variants - are resistant to proteolytic					
PT	cleavage into its two-chain form, used to treat malignancies					
PT	associated with HGF receptor					
PS	Example 1; Fig 6; 87pp; English.					
CC	Plasmid pCisEBON (a pRK5 derivative) is an episomal CMV driven					
CC	expression plasmid. HuHGF variants with enhanced receptor binding					
CC	activity were produced by site-directed mutagenesis. Stable					
CC	populations of preferred HGF variants were obtained by transfecting					
CC	human embryonic kidney 293 cells and then these were subcloned in					
CC	pCisEBON. See R52940-R52949 for examples of pref. HGF variants.

PI	Williams ME;							
PI	WPI; 93-093936/11.							
DR	P-PSDB; R33549.							
DR	DNA encoding specific human calcium channel sub-units - used for							
PT	identifying calcium channel agonists and antagonists and							
PT	diagnosing Lambert Eaton syndrome							
PT	Disclosure; Page 111-120; 150pp; English.							
PS	DNA encoding the alpha 1B subunit was isolated by screening a							
CC	human basal ganglia cDNA library with fragments of the rabbit							
CC	skeletal muscle calcium channel alpha 1 subunit-encoding cDNA.							
CC	A portion of one of the positive clones was used to screen an IMR32							
CC	cell cDNA library. Clones that hybridized to the basal ganglia							
CC	DNA probe were used to further screen an IMR32 cell cDNA library							
CC	to identify overlapping clones that in turn were used to screen a							
CC	human hippocampus cDNA library. In this way, a sufficient series of							
CC	clones to span nearly the entire length of the nucleotide sequence							
CC	encoding the human alpha 1B subunit was obtained. PCR amplification							
CC	of specific regions of the IMR32 cell alpha 1B mRNA yielded							
CC	additional segments of the alpha 1B coding sequence. A full-length							
CC	alpha 1B DNA clone was constructed by ligating portions of the							
CC	partial cDNA clones (see Q37817, Q37818). Alpha 1B-1 and alpha							
CC	1B-2 are derived by alternative splicing of the alpha 1B subunit							
CC	transcript.							
CC	Sequence 7362 BP; 1446 A; 2276 C; 2214 G; 1426 T;

High mol. wt. collagen-like protein polymers - capable of being  
produced in unicellular microorganisms  
PS Disclosure; Page 38; 82pp; English.  
CC The sequences given in 043030-34 encode examples of recombinantly  
CC produced DCP collagen-like polymers (CLPs) which consist of repeated  
CC tripeptide sequences selected from a wide range of GXY sequences,  
CC where X and Y can be any amino acid. These sequences can be cloned  
CC into plasmids and used to transform E. coli to produce the DCP  
CC proteins. DCP peptides comprise repeated units of; A = GAGPAGPP,  
CC B = GSRRDPGP and/or C = GAHPAGPK. These polymers may be used to  
CC raise anti-DCP antibodies in rabbits. These polymers have molecular  
CC weights of >30 kD and are able to form helices due to interchain  
CC linkages. These polymers pref. contain a proportion of tripeptide  
CC triad sequences found in natural collagens, pref. mammalian collagens.  
CC The CLPs impart unique characteristics to materials such as fibres,  
CC membranes, films, coatings, hydrogels, colloid suspensions and moulded  
CC articles.

The scores below are sorted by initial score.  
Significance is calculated based on initial score.

A 100% identical sequence to the query sequence was not found.

The list of best scores is:

# FastDB - Fast Pairwise Comparison of Sequences Release 5.4

Results file sq5inv.res made by on Wed 5 Apr 95 20:39:41-PDT.

Query sequence being compared:US-08-162-407-5' (1-988)  
 Number of sequences searched: 313646  
 Number of scores above cutoff: 4688

Results of the initial comparison of DS-08-162-407-5' (1-988) with:

- Data bank : EMBL-NEW 1, all entries
- Data bank : GenBank 86, all entries
- Data bank : GenBank-NEW 1, all entries
- Data bank : UEMBL 41 86, all entries

A scatter plot showing the relationship between the number of non-zero entries in the first matrix (x-axis) and the number of non-zero entries in the product of two sparse matrices (y-axis). The x-axis is labeled from 0 to 100 in increments of 10. The y-axis is labeled from 0 to 150 in increments of 50. The data points are as follows:

Number of non-zero entries in the first matrix	Number of non-zero entries in the product

3. DS-08-162-407-5' (1-988)  
HS40LIR3 epstein-barr virus simple repeat array (ir3).

LOCUS	DEFINITION	15-JUN-1990
HS4QLIR3	1150 bp ds-DNA	VRL
epstein-barr virus simple repeat array (ir3).		
J02079		
repeat region.		
ebv (epstein barr virus) from human.		
Epstein-Barr virus		
Viridae; ds-DNA enveloped viruses; Herpesviridae;		
ORGANISM		

REFERENCE  
1 (bases 1 to 1150)

COMMENT	full automatic Lambda DR2 can be obtained from CLONTECH Laboratories, Inc., 4030 Fabian Way, Palo Alto, CA 94303, USA. To place an order call (415) 424-8222 or (800) 662-2566, extension 1. International customers, please contact your local distributor. For technical information, call (415) 424- 8222 or (800) 662-2566, extension 3. This sequence was compiled by Andrew Murphy and revised at CLONTECH; this vector has not been completely sequenced. If you suspect there is an error in this sequence, please contact CLONTECH's technical Service Department at (415) 424-8222 or (800) 662-2566, extension 3 or E-mail CLONTECH@BIOTECHNET.COM.

COMMENT CDS

Listed under this feature are all known protein coding regions as well as all the major open reading frames in the sequence. In general the term major is taken as the longest frame in a particular region taking into account the adjacent longest frames and likely transcription signals. Note that on this basis some long overlapping frames have been excluded and on the other hand some small frames have been included which might represent exons or genes because they occur in a logical combination with other features or because of some other experimental data. The reading frames are named according to the Bam HI fragment in which they start. eg BALF3 is the third leftward frame starting in Bam HI fragment A. BORF1 is the first rightward frame in Bam HI fragment O. If there is an obvious TATA sequence followed by an in frame Met codon that satisfies the rules of Kozak [12] in that there is a purine at -3 and/or a G at +4 then the reading frame is numbered from the A of the ATG to the base preceding the termination codon. If there is no obvious initiation codon or there is a substantial reading frame in phase before the ATG then the reading frame is numbered from the first base of the first codon.

SITES of POLYA signals  
This feature lists all occurrences of the sequence AATAAA which is found normally approximately 20 bases upstream of the mRNA processing/polyA addition site. The rarely used homolog ATTAAG is only listed when it is found in a position close to the end of a major reading frame.

SITES of DONOR and ACCEPT sequences  
This is not a comprehensive listing of all such sequences and only the positions of a few have been noted because they occur in potentially interesting positions. The number quoted in the table is the position of the terminal base in the intron in each case. Restriction enzyme SITES.  
Only the positions of the sites Bam HI (BAM) are listed.  
RPT  
This feature is used to define repetitive sequences.  
SITE DEL  
This feature defines deletions in B95-8 with respect to other

strains such as RAJI and also to deletions in other strains such as P3HR1 and DAUDI with respect to B95-8.

SITE HPN

Denotes sequences with twofold symmetry ie could form hairpin loops. This is not a comprehensive list - only a few occurrences noted.

ORGRPL

Denotes the region that encompasses an origin of replication (ori P). [13].

NUMBERING

The DNA sequence of B95-8 EBV has been revised [19]. The original (Baer et al, 1984) base 359 has been deleted so the new sequence around that position reads TCAGTCTTT. To avoid renumbering the entire sequence, position 1 has been moved 1 base to the left of the EcoRI site separating EcoRI Dhet from EcoRI I (ie the first A of AGAATTC).

frames are named according to the Bam HI fragment in which they start. eg BAlF3 is the third leftward frame starting in Bam HI fragment A. BORF1 is the first rightward frame in Bam HI fragment O. If there is an obvious TATA sequence followed by an in frame Met codon that satisfies the rules of Kozak [12] in that there is a purine at -3 and/or a G at +4 then the reading frame is numbered from the A of the ATG to the base preceding the termination codon. If there is no obvious initiation codon or there is a substantial reading frame in phase before the ATG then the reading frame is numbered from the first base of the first codon.

#### SITES of POLYA signals

This feature lists all occurrences of the sequence AATAAA which is found normally approximately 20 bases upstream of the mRNA processing/polyA addition site. The rarely used homolog ATTAAG is only listed when it is found in a position close to the end of a major reading frame.

#### SITES of DONOR and ACCEPT sequences

This is not a comprehensive listing of all such sequences and only the positions of a few have been noted because they occur in potentially interesting positions. The number quoted in the table is the position of the terminal base in the intron in each case.

#### Restriction enzyme SITES.

Only the positions of the sites Bam HI (BAM) are listed.

#### RPT

This feature is used to define repetitive sequences.

#### SITE DEL

This feature defines deletions in B95-8 with respect to other strains such as RAJI and also to deletions in other strains such as P3HR1 and DAUDI with respect to B95-8.

#### SITE HPN

Denotes sequences with twofold symmetry ie could form hairpin loops. This is not a comprehensive list - only a few occurrences noted.

ORGRPL

Denotes the region that encompasses an origin of replication (ori P).[13].

#### NUMBERING

The DNA sequence of B95-8 EBV has been revised [19]. The original (Baer et al, 1984) base 359 has been deleted so the new sequence around that position reads TCAGTCITT. To avoid renumbering the entire sequence, position 1 has been moved 1 base to the left of the EcoRI site separating EcoRI Dhet from EcoRI I (ie the first A of AGAATTC).

CCS

Listed under this feature are all known protein coding regions as well as all the major open reading frames in the sequence. In general the term major is taken as the longest frame in a particular region taking into account the adjacent longest frames and likely transcription signals. Note that on this basis some long overlapping frames have been excluded and on the other hand some small frames have been included which might represent exons or genes because they occur in a logical combination with other features or because of some other experimental data. The reading frames are named according to the Bam HI fragment in which they start. eg BAF3 is the third leftward frame starting in Bam HI fragment A. BORF1 is the first rightward frame in Bam HI fragment O. If there is an obvious TATA sequence followed by an in frame Met

CC codon that satisfies the rules of Kozak [12] in that there is a  
CC purine at -3 and/or a G at +4 then the reading frame is numbered  
CC from the A of the ATG to the base preceding the termination codon.  
CC If there is no obvious initiation codon or there is a substantial  
CC reading frame in phase before the ATG then the reading frame is  
CC numbered from the first base of the first codon.

#### SITES of POLYA signals

CC This feature lists all occurrences of the sequence AATAAA which is  
CC found normally approximately 20 bases upstream of the mRNA  
CC processing/polyA addition site. The rarely used homolog ATTAAA is  
CC only listed when it is found in a position close to the end of a  
CC major reading frame.

#### SITES of DONOR and ACCEPT sequences

CC This is not a comprehensive listing of all such sequences and only  
CC the positions of a few have been noted because they occur in  
CC potentially interesting positions. The number quoted in the table  
CC is the position of the terminal base in the intron in each case.

#### Restriction enzyme SITES.

CC Only the positions of the sites Bam HI (BAM) are listed.

#### RPT

CC This feature is used to define repetitive sequences.

#### SITE DEL

CC This feature defines deletions in B95-8 with respect to other  
CC strains such as RAJ1 and also to deletions in other strains such as  
CC P3HR1 and DAUDI with respect to B95-8.

#### SITE HPN

CC Denotes sequences with twofold symmetry ie could form hairpin  
CC loops. This is not a comprehensive list - only a few occurrences  
CC noted.

#### ORGRPL

CC Denotes the region that encompasses an origin of replication  
CC (ori P). [13].

#### NUMBERING

CC The DNA sequence of B95-8 EBV has been revised [19]. The original  
CC (Baer et al, 1984) base 359 has been deleted so the new sequence  
CC around that position reads TCAGTCTTT. To avoid renumbering the

CC entire sequence, position 1 has been moved 1 base to the left of  
CC the EcoRI site separating EcoRI Dhet from EcoRI I  
CC (ie the first A of AGAATTC)

PT Complementary screening for genes and prods. - e.g. RAS protein  
PT and cAMP, that modify, complement or suppress genetic defect and  
PT correct associated phenotypic alteration  
PS Disclosure; Page 141; 169pp; English.  
CC In the specification this sequence is given the SEQ ID NO. 1 and  
CC is additional to SEQ ID NO.s 1-35, i.e. the specification contains  
CC two sequences denoted as SEQ ID NO.1 ! The only reference to SEQ ID  
CC NO.1 in the text is to a 10 base pair linker. The origin and  
CC identity of Q14645 is therefore obscure. Other sequences  
CC in the specification were isolated from human glioblastoma cells  
CC and encode cyclic nucleotide PDEs and RAS-related polypeptides.  
CC (They were isolated by their ability to complement or suppress  
CC genetic defects in a biochemical pathway involving cAMP or which is  
CC controlled by a RAS protein).

PT	New CD53 cell surface antigen and DNA encoding it - for	
PT	immuno-therapy and diagnosis of haematopoietic neoplasms, etc.	
PS	Example 7; Fig 11; 160pp; English.	
CC	A CDNA library was constructed using RNA prepared from HL60 cells	
CC	induced with PMA. The library was transfected into COS cells and	
CC	cells expressing surface antigens were recovered by panning with	
CC	the anti-ICAM MAb8 8f5 and 84H10. Episomal DNA was recovered from	
CC	the panned cells and the expression-panning cycle repeated twice	
CC	more to obtain a cDNA clone designated pICAM-1. The availability of	
CC	a functional ICAM-1 cDNA will allow a better assessment of the role	
CC	of ICAM-1/ICAM-1 mediated adhesion in antigen-specific leukocyte	
CC	function, including i-cell mediated killing, i-helper responses and	
CC	antibody-dependent cell mediated killing.	
CC	Sequence 1846 BP; 416 A;	531 G; 319 T;

PT	Rapid immuno-selection cloning - used to clone genes encoding
PT	cell surface antigens associated with mammalian T lymphocytes.
PS	Disclosure; fig. 11; 69pp; English.
CC	ICAM-1 is a ligand for LFA-1 (a major receptor of T and B cells
CC	and granulocytes). ICAM contains no RGD motifs and is instead
CC	homologous to the neural cell adhesion molecule (NCAM). COS cells
CC	transfected with ICAM cDNA clone bind myeloid cells by a specific
CC	interaction which can be blocked by monoclonal antibodies directed
CC	against either ICAM-1 or LFA-1.

PT New inter-cellular adhesion molecule-7, derived antibodies etc. -  
PT are used for diagnosis and treatment of inflammation and  
PT tumours, and for new DNA coding sequences  
PS Claim 8; Fig 8; 74pp; English.  
PS ICAM-1 and functional derivs. are new. Also new are recombinant DNA  
CC able to express ICAM-1 or derivs. ICAM-1 is able to bind to a molecule  
CC present on the surface of lymphocytes and contains at least one of 17  
CC specified AA sequences (p80441 to p80457). ICAM-1 is a 76-97KD  
CC glycoprotein which is a binding partner for IFA-1, and is involved in  
CC lymphocyte recognition and adhering to cell surfaces. ICAM-1 contains  
CC 5 Ig-like domains.  
SQ Sequence 3113 BP; 735 A; 905 G; 833 G; 640 T;

T	New metallo-proteinase inhibitor polypeptide(s) - and DNA	

encoding them, for treatment of tumour cell dissemination and  
rheumatoid arthritis  
Claim 12; Fig 1; 63pp; English.  
Sequence may be used to transform a procarvotic or eukaryotic  
expression system to give a product with all the biological  
properties of naturally occurring metalloproteinase inhibitor.  
The product has therapeutic use in inhibiting tumour dissemination  
during chemotherapy and radiation therapy, impurged bone marrow cell  
harvesting etc. The inhibitor may also be useful in encapsulating  
tumours aiding clean excision, and in treatment of emphysema, Paget's  
disease, osteoporosis, scleroderma and bedsores.  
The gene product also has application in autoimmune disorders eg.  
rheumatoid arthritis and multiple sclerosis.  
See also Q06584.

Eukaryotic cells transformed with mammalian phospholipid or protein kinase DNA - useful in assays for compounds involved in cell growth regulation and for treating cancers  
 Disclosure: Page 42-44; 71pp; English.  
 The sequences given in Q57014-17 encode protein kinase C (PKC) epsilon, gamma, delta and nu respectively. These sequences were transformed into *Schizosaccharomyces pombe* cells under the regulatory control of the nmt promoter in an embodiment of the invention. In the presence of thiamine the promoter is inactive and the cells carrying the PKC plasmids grow as the parental strain. In the absence of thiamine the nmt promoter functions and the PKC is induced. PKC activity is substantially increased under these conditions. Cells containing constructs such as this, are useful in assays for detecting compounds involved in cell growth regulation. It is also used as a basis for detecting compounds for treating cancers and the formation of blood vessel plaques.

CC	To identify antigens of E. tenella, expression libraries were
CC	prep'd. in lambda vector, lambda gtl1, using cDNA prep'd. from poly
CC	mRNA isolated from E. tenella oocysts. The cDNA expression
CC	library was screened with monoclonal antibody (MAb) 12-07 which w
CC	raised against the sporozoite stage of E. tenella. The library
CC	to be screened was plated on a host that allows lysis and plaque
CC	formation. During induction of the antigens encoded by the plaque
CC	the plaques were identified by screening the filters with MAb 12-
CC	The cDNA inserts from the MAb 12-07 positive phage were cloned in
CC	bacteriophage M13 and subjected to sequence analysis. Following
CC	sequence analysis, E. tenella antigen tc-7a was identified.
CC	Sequence 543 BP; 229 A; 135 C; 161 G; 18 T;

FT PT Hepatocyte growth factor variants - are resistant to proteolytic
FT PT cleavage into its two-chain form, used to treat malignancies
FT PT associated with HGF receptor
FT PS Example 1; Fig 6; 87pp; English.
FT CC Plasmid pCiEBON (a pRK5 derivative) is an episomal CMV driven
FT CC expression plasmid. HuHGF variants with enhanced receptor binding
FT CC activity were produced by site-directed mutagenesis. Stable
FT CC populations of preferred HGF variants were obtained by transfecting
FT CC human embryonic kidney 293 cells and then these were subcloned in
FT CC pCiEBON. See R52940-R52949 for examples of pref. HGF variants.

FT Cloned human neuronal calcium channel sub-types - useful in
FT calcium flux assays to screen for neurone-specific calcium
FT channel ligands
PS Claim 2; Page 63-77; 101pp; German.
CC Human neuroblastoma cell line, hippocampus, frontal and temporal
CC cortex and visual cortex cDNA banks were screened with a probe
CC containing carboxy skeletal muscle Ca-channel cDNA. The cDNA clone
CC pR14-5.3.1 overlaps with clone p1247-14.1.1.1 (see Q29263). The
CC following differences are observed between the two sequences:
CC (nucleotide and position in pR14-5.3.1 given in brackets):
CC 1.Cytosine at position 520 (T: 3507); no change in deduced amino
CC acid sequence. 2.Cytosine at position 775 (G; 3768); no change in
CC deduced AA sequence. 3.Cytosine at position 1617 (T;4611).
CC 4.Adenosine at position 2360 (G; 5353). 5.deletion of 6 nucleotides
CC at position 708 (CGGAA; 3695-3700). 6. deletion of an Adenosine
CC residue at position 1013 which leads to a stop codon at position
CC 1028-1030. 7. at position 3240 there are a further 2199 nucleotides
CC of the 3'UTR which are absent from pR14-5.3.1. (The deletion of
CC Adenosine at position 1013 is thought to be a cloning artefact).
CC The sequence can be inserted into a eukaryotic expression vector for
CC use in transforming suitable host cells. Cell lines producing human
CC neuronal calcium channel proteins can be used for screening for Ca
CC channel ligands (agonists or antagonists). See also Q29259-Q29275.

6. US-08-162-407-5' (1-988)

CC encoding the human alpha 1B subunit was obtained. PCR amplification  
CC of specific regions of the IMR32 cell alpha 1B mRNA yielded  
CC additional segments of the alpha 1B coding sequence. A full-length  
CC alpha 1B DNA clone was constructed by ligating portions of the  
CC partial cDNA clones (see Q37817, Q37818). Alpha 1B-1 and alpha  
CC 1B-2 are derived by alternative splicing of the alpha 1B subunit  
CC transcript.

CC	transcript	Sequence	1446 A;	2276 C;	2214 G;	1426 T;
SQ		7362 BP;				

Initial Score	=	143	Optimized Score	=	442	Significance	=	8.44
Residue Identity	=	49%	Matches	=	518	Mismatches	=	423
Gaps	=	104	Conservative Substitutions	=	0			

X                      10                      20                      30                      40                      50

 PT Caenorhabditis elegans cell death-protective gene - used to  
 PT develop agents for preventing cell death or for reducing  
 PT population of cells  
 PS Disclosure; Page 61-64; 112pp; English.  
 CC The protein product of the human oncogene bcl-2 was found to have a  
 CC similar sequence to the ced-9 protein. ced-9 is essential for  
 CC C. elegans development and apparently functions by protecting cells  
 CC during development from programmed cell death. ced-9 was shown to  
 CC function by antagonising the activities of cell death genes ced-3  
 CC and ced-4. The ced-9 gene can be used for developing agents for  
 CC treating a condition characterised by increased cell death such as  
 CC myocardial infarction, stroke, traumatic brain injury,  
 CC neurodegenerative disease, muscular degenerative disease, ageing,  
 CC hypoxia, ischaemia, toxemia, infection or hair loss. It can also  
 CC be used for reducing a population of cells in the treatment of  
 CC neoplastic growth cancerous tissue, infected cells or autoreactive  
 CC immune cells.

DR	WPI: 88-008633/02.
DR	P-PSDB; P80987.
PT	Detection of B-cell neoplasms -
PT	by extn. of proteins or RNA from B-cells and quantitation using
PT	specific antibody or DNA probe
PS	Claim 8; Fig 2A-2D; 23pp; English.
PS	A human bcl-2 gene substantially free of introns is claimed. Also claimed
CC	is a substantially pure preparation of a protein having an N-terminal end
CC	encoded by the first exon of the human bcl-2 gene having about 239 (P80987) or 205 (P80988) AA residues. B-cell
CC	bcl-2-alpha having about 239 (P80987) or 205 (P80988) AA residues. B-cell
CC	neoplasms which are associated with t(14;18) chromosome translocations
CC	cause an increase in the expression of both mRNA and the protein prods.
CC	of the bcl-2 gene. This is used to detect B-cell neoplasms including
CC	follicular lymphomas as well as other lymphomas. Bacterial isolates
CC	available as ATCC 67147 and 67148 can be used to express gene prods.
CC	alpha (n81292) and beta (n91293) resp. in bacteria.
CC	Sequence 5105 BP; 1281 A; 1225 C; 1286 G; 1313 T

DR	P-FSDB; R20465.
PT	DNA segments to produce iso-forms and chimeric forms of RAR -
PT	have sequence encoding protein which display ligand binding and
PT	transcription activating properties of a gamma iso-form of RAR
PS	Claim 5; Fig 1; 52pp; English.
CC	The sequence is that of a clone lambda-mE13.20 which encodes mouse
CC	retinoic acid receptor (RAR) isoform RAR-gamma-A, it was isolated
CC	from a 7.5 day mouse embryo lambda-gr10 cDNA library. It diverges
CC	from the clone lambda-mE7.1 as indicated at nucleotides 1 to 435.
CC	this corresponds to with a splice junction between exon 1 and exon
CC	2 of the human RAR-alpha gene. It can be used for screening of
CC	agonists and antagonists of the gamma receptor effector system and
CC	for identifying ligands capable of binding to a gamma isoform of RAR.
CC	See also Q20542.

T04557 604 Arabidopsis thaliana cDNA clone 39B11T7.

LOCUS	T04557	374 bp <i>ss</i> -mRNA	EST
DEFINITION	604 Arabidopsis thaliana cDNA clone 39B117.		
ACCESSION	T04557		
KEYWORDS	EST.		

Thale cress clones-39B1117 library-Lambda-PRL2 strain-var. columbica vector-lambda Zip-Lox. Reitel-Sal. Reitelc2Not Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark- rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques). The vector is BR1's Lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA.

ORGANISM *Arbidopsis thaliana*  
 Method of analysis using CARGO or PRIMO CONT.  
 Matched to: *Arbidopsis thaliana*  
 Eukaryota; Embryobionta; Magnoliophyta; Magnoliopsida;  
 Dilleniidae; Capparales; Brassicaceae.

The scores below are sorted by initial score.

Significance is calculated based on initial score.

A 100% identical sequence to the query sequence was not found.

The list of best scores is:

Sequence Name	Description	Length	Score	Init. Opt.	Sig. Frame

PT Attenuated live vaccine for Delaware strain infectious bursal  
PT disease virus - is produced by screening with a monoclonal  
PT antibody and used for immunising poultry against IBDV  
PS Claim 9; Fig 1A-1K; 24pp; English.  
CC The applicants have developed a Mab, designated Mab 67, which  
CC neutralises wild-type Delaware strain IBDV. It was developed  
CC according to the method set forth in US Patent 4,956,452. The  
CC hybridoma cell line expressing Mab 67 has been deposited under ATCC-  
CC HB11222. Bps 1-1404 of Q45441 is the nucleotide sequence of the  
CC gene responsible for the expression of Delaware IBDV structural  
CC protein(s) recognised by Mab 67. Mab 67 can be used in an assay to  
CC determine the presence of Delaware type IBDV and can be employed to  
CC prepare a vaccine conferring challenge protection against Delaware-  
CC type IBDV.

CC	Gene regulating expression of lipase - useful in prodn. of fatty acid from fats and fatty oils, prodn. of ester and addn. to detergents	
FS	Claim 1; Fig 3; 9pp; Japanese.	
CC	The gene regulating lipase expression was obtd. from a Pseudomonas clone, esp. from Pseudomonas KWI-36(FERM P-9659). Lipase is useful for the prodn. of fatty acid from fats and oils, the prodn. of esters, and for addition to biological detergents. Transformants contg. the lipase structural gene together with its regulatory gene can be used to produce 20-300 times greater lipase activity than CC transformants bcp; the lipase structural gene alone.

PT	Cloned cDNA encoding Aleuria aurantia lectin - used for producing

PT lectin for diagnosing cancer or sepg. or analysing sugar chains

PS Disclosure; fig 1; 1993; English.

CC This cDNA encodes A.aurantia lectin which has a binding affinity for fucosyl linkages. It recognises the change of oligosaccharide chains in cell surface glycoproteins and hence can be used as a diagnostic agent for e.g. cancer, where the oligosaccharide chains are modified. It can also be used for sepg. or analysing various sugar chains.

PT Prepn. of active lipase in high quantities - by subjecting to denaturation and restructuring in presence of chaperone molecule

PS Claim 26; Page 47-48; 78pp; English.

CC A DNA construct is claimed comprising a lipase coding sequence fused to a sequence coding for a chaperone molecule. One fusion construct is specifically claimed where the lip and lim coding sequences are both from Pseudomonas cepacia. The SEQ ID number for the specifically claimed fusion does not correspond to a nucleotide

```

CC sequence so Q44282 (the only fusion gene sequence in the
CC specification) is taken to be the intended fusion gene. Production
CC of active lipase is enhanced by denaturation followed by
CC renaturation in the presence of a lipase modulator chaperone
CC protein.

PT Eukaryotic neurocan polypeptide(s) with epidermal growth factor,  
PT lectin or complement binding activity - used in the diagnosis,  
PT treatment or research of hypersensitivity and allergic diseases  
PS Claim 1; Page 69-75; 105pp; English.  
CC This sequence encodes a neurocan polypeptide. This protein has

CC several biological activities, including cell adhesion, leukocyte-  
CC endothelial cell recognition, tissue-related inflammation allergies,  
CC cellular and/or humoral hypersensitivity, trauma, neuronal  
CC development, and cell transport and/or infection. Compositions  
CC containing them can be used as modulators of these conditions, and  
CC may be used as therapeutic, diagnostic, and/or research tools.  
CC Neurocan peptides can be used to mimic proteins, such as lectins,  
CC cell adhesion molecules, versicans, aggrecans or gelatins, as  
CC receptor or effector subtypes. The protein can be used to treat  
CC diseases involving a qualitative or quantitative pathological  
CC abnormality of cell adhesion or leukocyte-endothelial cell recognition,  
CC or a functionally associated molecule such as a membrane cytoplasmic  
CC protein, lipid, carbohydrate, saccharide, nucleoside, enzyme or ion.

2. US-08-162-407-6 (1-705)  
Sequence of AtT20 murine prothormone convertase 2 c  
Q43249

ID Q43249 standard; cDNA; 2012 BP.

AC Q43249;  
DT 24-SEP-1993 (first entry)

24-SEP-1993 (first entry)  
Sequence of AtT20 murine prohormone convertase 2 cDNA.  
Prohormone convertase; enzyme; cleavage; ss.  
Mus musculus.

CC P450 enzyme, P450SU2; and (b) the electron donor iron sulphur  
CC protein FeS-A. It is contained in a recombinant plasmid which is  
CC used to transform host *Streptomyces* species which in turn are used  
CC to coat a plant seed to transform the plant. The resultant trans-  
CC formants are resistant to herbicides.  
CC See also Q1126.

CC	Ad Red mRNA undergoes alternate splicing to produce two different forms, with the less abundant form containing 18 nucleotides encoding 6 amino acids in the middle of the protein. The alternative splicing site occurs at the beginning of exon 7 (see feature table).	5089 BP;	902 A;	1401 C;	1633 G;	1100 T;

PT	New glutamic acid receptor and gene - for use in analysis of	
PT	synaptic signal translation, and diagnosis of brain disease	
PS	Claim 1; Page 21-24; 35pp; Japanese.	
CC	The sequence codes for a glutamic acid receptor. The receptor is	
CC	useful for the analysis of nerve signal translation; within the	
CC	synapse, expression of synapse plasticity, nerve cell necrosis,	
CC	brain structure and brain disease. It can also be used in gene	
CC	therapy.

REFERENCE	1 (bases 1 to 794)
AUTHORS	Harberd,N.P., Flavell,R.B. and Thompson,R.D.
TITLE	Identification of a transposon-like insertion in a Glu-1 allele of wheat

**JOURNAL  
STANDARD  
COMMENT**

Mol. Gen. Genet. 209, 326-332 (1987)

full automatic  
sequence comparison with Cheyenne  
Glu-Ally sublocus gene has shown that the coding sequence of the  
Chinese Spring sublocus gene is interrupted by a 8.0 kb insertion  
sequence. A DNA duplication and inverted terminal sequences are  
flanking the insertion sequence. See also x05996.  
Data kindly reviewed (18-Apr-1988) by Flavell R.B.

 Single copies, 10 cents.

DEFINITION Wheat gene for HMW-glutenin subunit located on chromosome 1A.  
ACCESSION X03042  
KEYWORDS direct repeat; glutenin; inverted repeat; seed storage protein;  
signal peptide; storage protein.  
SOURCE wheat.  
ORGANISM  
Triticum aestivum  
Eukaryota; Plantae; Embryobionta; Magnoliophyta; Liliopsida;  
Commelinidae; Cyperales; Poaceae.  
REFERENCE 1 (bases 1 to 2915)  
AUTHORS Forde, J., Malpica, J.M., Halford, N.G., Shewry, P.R., Anderson, O.D.,  
Greene, F.C. and Milfin, B.J.  
TITLE The nucleotide sequence of a HMW glutenin subunit gene located on  
chromosome 1A of wheat (Triticum aestivum L.)  
JOURNAL Nucleic Acids Res. 13, 6817-6832 (1985)  
STANDARD full automatic  
COMMENT Though the premature stop codon may not affect gene expression the  
author suggests that the gene is a pseudogene, because no small in  
vivo transcripts of chromosome 1A was found. Within the coding  
sequence are two multiple repeated amino acid motifs, PQGGQ and  
GYPRSLQQ  
Data kindly reviewed (19-MAR-1986) by J. Forde.

Identification of a transposon-like insertion in a Glu-1 allele of  
wheat  
JOURNAL  
Mol. Gen. Genet. 209, 326-332 (1987)

STANDARD	COMMENT
full automatic	Sequence comparison with Cheyenne
	Glu-Ally spring sublocus gene has shown that the coding sequence of the Chinese Spring sublocus gene is interrupted by a 8.0 kb insertion sequence. A DNA duplication and inverted terminal sequences are flanking the insertion sequence. See also x05996.
	Data kindly reviewed (18-Apr-1988) by Flavell R.B.

 regulate T-cell development and tumorigenic phenotype and to  
 block T-cell activation in auto-immune disease  
 PS Disclosure; Fig 20; 98pp; English.  
 CC An SL 12.4 cDNA library was constructed from which six cDNAs were  
 isolated via subtractive hybridisation against a related sister  
 lymphoma cell line, SL 12.3. Five clones were obtained representing  
 genes which are preferentially expressed in the SL 12.4 T cell  
 clone, and are undetectable or weakly expressed in SL 12.3.  
 CC These clones are 19.5 (Q14534), 20.5 (Q14533), 19.1 (Q14532),  
 19.2 (Q14531) and 19.4 (Q14530).  
 CC No predicted protein sequence is given, incomplete cDNA clone,  
 CC therefore, no long ORF.  
 CC See also Q14530-34.

PT Bone-related sulphatase-like protein, OSF-8 - degrades sulphate  
PT groups of proteoglycan sugar chains, useful for treating bone  
PT metabolic diseases  
PS Claim 3; Page 17-22; 29pp; English.  
CC cDNA of mouse OSF-8 (MOSF-8) was isolated from mouse osteoblastic  
CC cell line MC3T3-E1 cDNA library by a combination of PCR and the  
CC subtraction method, and by the differential screening method. OSF-8  
CC has homology with known representative sulphatase molecules but  
CC belongs to a new subclass different from those so far reported.  
CC The inventors claim the precursor protein (R51355 AAs 1-556) which  
CC includes the signal peptide (AAs 1-18), and they also claim a protein  
CC comprised of residues 19-556. They also claim DNA or RNA encoding  
CC the claimed proteins.

PT Mammalian G protein-coupled glutamate receptors - activate  
PT phospholipase C or stimulate inositol phospholipid metabolism,  
PT for use in diagnosis and identification of receptor agonists and  
PT antagonists  
PS Disclosure; Fig 5; 144pp; English.  
CC The sequence given encodes mammalian G protein-coupled glutamate  
CC receptor (GLU-G-R) subtype 1a. The clone was isolated from Xenopus

CC oocyte cultures which had been injected with RNA extracted from a  
 CC cerebellum sublibrary. Expression of GLU-G-R activity was assessed by  
 CC voltage clamp assay. Plasmid DNA encoding GLU-G-R activity was  
 CC isolated by replica-plating experiments. The protein encoded by clone  
 CC 45-A was found to act as a receptor for the neurotransmitter glutamate,  
 CC and may play a critical role in the control of neurons. GLU-G-R and  
 CC antibodies may be used to identify agonists and antagonists of  
 CC GLU-G-R-mediated neuronal excitation and in diagnosis.

 PT Particle-mediated transformation of woody plants - for  
 PT construction of transgenics(s) expressing high levels of Bacillus  
 PT toxin  
 PS Example; Fig 6,7; 43pp; English.  
 CC The sequence is that of plasmid pAMVBT4 which encodes a wild type  
 CC Bacillus thuringiensis (Bt) gene from Bt strain HD-1-Dipel. This  
 CC codes for an insect toxin amino-terminal of the delta endotoxin  
 CC crystal protein, the synthetic sequence was used as substitution of  
 CC the first 138 codons has previously been found to enhance expression  
 CC of the protein in plant cells. It can be used in a method of particle  
 CC mediated transformation which is effective with various tissue types  
 CC of poplar, incl. protoplasts, internode and petiole segments and, more  
 CC efficiently with nodule cultures. Transgenic trees produced express  
 CC sufficient levels of toxin to provide toxicity to feeding insects.

DNA sequence of plant vector pAMVBTS

ID N90183 standard; DNA; 4583 BP.  
 AC N90183;  
 DT 1-NOV-1989 (first entry)  
 DE DNA sequence of plant vector pAMVBTS  
 KW Chimeric gene; transgenic plants; Bacillus thuringiensis;  
 KW delta-endotoxin; promoter; translational enhancer; polyadenylation  
 KW sequence; tobacco plant; cotton plant; Lepidoptera; Diptera; Coleoptera.  
 KW vector; pAMVBTS.  
 PN W08904868-A.  
 PD 01-JUN-1989.  
 PF 17-NOV-1988; 004107.  
 PR 19-NOV-1987; US-123054.  
 PA (AGRA) Agracetus.  
 PI Barton KA, Umbeck PF;  
 DR WPI; 89-178387/24.  
 PT Chimeric gene construct for producing transgenic plants - contains  
 PT delta-endotoxin of Bacillus thuringiensis for toxicity to, eg  
 PT lepidoptera sp.  
 PS Disclosure; fig. 4a-b; 55pp; English.  
 CC The sequence is of vector pAMVBTS (ATCC 53637), comprising ampicillin  
 CC resistance plasmid replicon derived from pMT21, and a chimeric gene which  
 CC consists of, in order from the 5' end, a DNA fragment corresp. to  
 CC cauliflower mosaic virus 35S transcription promoter, DNA leader fragment  
 CC corresp. to alfalfa mosaic virus coat protein mRNA 5' noncoding region, a

CC DNA fragment corresp. to N-terminal of B. thuringiensis delta-endotoxin,  
 CC and a DNA fragment corresp. to polyadenylation region of nopaline  
 CC synthase. The vector is used to transform plants, esp. tobacco and  
 CC cotton, which then produce the toxin which is active against  
 CC Lepidopteran, Dipteran and Coleopteran pests. This trait is then  
 CC transmitted by Mendelian inheritance.  
 SQ Sequence 4583 BP; 1316 A; 991 C; 977 G; 1299 T;

PT Polypeptide(s) with amino acid sequence of an animal interferon -  
 PT useful as antiviral, anticancer and immuno-modulator agents  
 PS Disclosure: Figs 9a, 9b, 62pp: English.

Disorders, 1992; 20: 227-231. England.

CC A bovine genomic DNA library was screened for IFN genes. Four  
CC bovine leukocyte IFN genes were identified (see N30039, N30040,  
CC N30041, N30042). Whereas the BoIFN-alpha-2 and -3 genes encode  
CC peptides with only minor apparent differences to BoIFN-alpha-1, the  
CC BoIFN-alpha-4 protein is as distinct from the other bovine peptides  
CC as are any two bovine and human leukocyte interferons. Three  
CC distinct bovine fibroblast IFN genes were also identified (see  
CC N30043, N30044, N30045). The bovine proteins are quite distinct  
CC from one another but show an even greater difference with the human  
CC peptide.
